

# EVERYWHERE AC-200

SAFE—CONNECTED—PRODUCTIVE

## ASSET TRACKING, MONITORING, AND MANAGEMENT

*Global businesses with remote assets need visibility to their entire operation. Whether it is monitoring a temperature sensor in Madagascar or a reading pressure valve in Greenland, tracking refrigerated goods in transit in Brazil, or tracking a delivery vehicle in New Zealand, our tools enable you to monitor and quickly address any issues that might arise, anywhere in the world.*

The AC-200 is a rugged Asset Communicator that enables companies to track and monitor their remote assets. The AC-200 can be installed in a vehicle or it can operate in a standalone mode using battery power. With two switch inputs and two relay outputs, the AC-200 can be easily combined with external sensors to provide monitoring

and control. For example, using the relay output, you can configure the device to disable an engine or close a remote valve.

In addition, the AC-200 features an on-device geofence, enabling minimal battery drain by transmitting data only when the device enters or exits the customer configured geofence.

Integrated with the EVERYWHERE Hub, you can quickly determine the location of all your assets and be alerted to situations you define, wherever they occur.

### KEY FEATURES

*Rugged compact form factor*

*Iridium® for global satellite communications*

*Real time GPS position reporting*

*On device geofencing*

*Secure communications*

*Two switch inputs*

*Two relay outputs*

*Remotely configurable*
