

INTELLIGENT ROUTING

SAFE—CONNECTED—PRODUCTIVE

DYNAMIC LEAST COST COMMUNICATIONS TECHNOLOGY
TO ENSURE YOU ARE ALWAYS IN COMMUNICATION

EVERYWHERE's Intelligent Routing technology provides seamless and dynamic routing of your communications in the most efficient manner based on available bandwidth among four network options—Satellite, Cellular, SMS, and Wi-Fi. Integrated within the EVERYWHERE Smartphone App, as well as within the EVERYWHERE Hub, the Intelligent Routing delivers messages between the App and the Hub, providing always connected communications in the most cost effective manner.

EXAMPLE USE CASE: WICHITA LINEMAN

A lineman is out checking out telephone poles in a rural area of western Kansas, where there is no cellular coverage. He uses the Everywhere App, paired with the EC-100, to communicate with the office via the Iridium Satellite network. During his day, he discovers issues with several telephone poles along the route. Using the EVERYWHERE App, he notifies his dispatcher of the issues, and snaps a geocoded picture of each telephone pole. The notifications are sent over the satellite network back to the office. However, because he is outside of cellular coverage, the App stores the pictures internally for later transmission. Once he returns to cellular or Wi-Fi coverage, the App automatically transmits the stored geocoded pictures. This occurs seamlessly, with no interaction by the user.

KEY FEATURES

Multi-network support: Wi-Fi, cellular, SMS, Iridium Satellite

Customer Configurable network prioritization

Least cost routing based on network requirements and availability

Seamless transition between networks

Automatic transmission and receipt of stored data upon return to cellular or Wi-Fi network for mobile originated and mobile terminated messages
